

## Caravan Charging/Car Charging

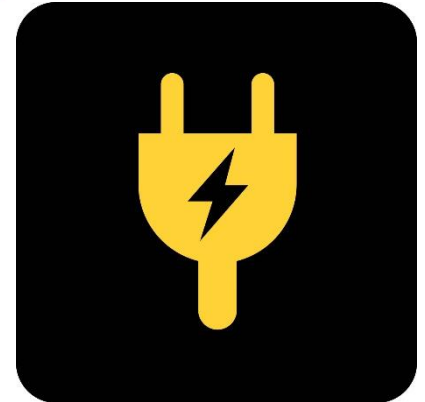

KiwiCamp has designed specific Charging Units to charge Caravans. There are two sizes to choose from either x2 or x4 outlets.

Each outlet comes with 12-amp RCD installed to ensure safety and restrict over usage. The housing is constructed of a light weight fiberglass ensuring longevity and durability.

Power use is not charged by the unit of power but rather the time the outlet is used. The appropriate price and length of use for any site can be set via the KiwiCash web services.

Charging points require a single phase 240v supply and an internet connection.

Customers can choose to plug in overnight or stop in for a 3-4 hour charge depending on their needs. E-bikes and other devices can also be charged from these Charging Units with a slight modification to standard 3 pin plug.

Electric car charging is also achieved by Charging Units of a similar design. Utilising the same lightweight fibreglass housing these electric chargers deliver reliable charging to suit most electric vehicles.

All of our vehicle chargers come with electrical certificate and are rated to NZ standards.
